

Task #07

Question : What is Ternary operator? Why we use them?

Ans : The ternary operator is a condensed way of making decisions in programming based on a condition. It takes the form of condition ? expression_if_true : expression_if_false.

- The condition is assessed first.
- If the condition is true, the expression before ? is executed.
- If the condition is false, the expression after : is executed.
- The result is the value of the executed expression.
